Not surprisingly, GIMP doesn't have as many features or as many bells and whistles as Photoshop. Instead, GIMP is more suited to being used as a standard image editor, with no specific image-editing features. Even so, it has many powerful features that take it beyond the realm of many other image editors. * **You can't make a selection, move, or resize layers in Photoshop. It's layer-based, not object-based**. So, for example, if you have a file saved as nine separate layers, you can move a part of the image, make a selection, and crop it, but you can't separate the different layers or recombine them (which you'll see in a moment). A canine model of posthemorrhagic hydrocephalus. This study characterizes the development of intracranial hypertension in immature dogs after complete brain hemorrhage. Two groups of six 4-week-old puppies underwent left-sided blood depletion by unilateral occlusion of the carotid and external carotid arteries followed by sham occlusion. The development of hydrocephalus was evaluated by serial transcranial Doppler studies of blood flow velocity in the middle cerebral artery and measurements of cerebral blood flow. Hydrocephalus was evident 1 week after injury and increased progressively until the end of the observation period, reaching a mean maximum elevation of the cerebrospinal fluid (CSF) pressure of 16.0 cm H₂O 1 week after surgery. Increased CSF production, documented by serial measurements of urinary excretion of sodium and creatinine, was evident by 4 weeks. Cerebral blood flow showed a moderate decline during the first 2 weeks but, by contrast, cerebral blood flow was well maintained. The flow velocity of the middle cerebral artery was normal in four of six animals and decreased gradually in the remaining two animals. Although the establishment of an animal model of posthemorrhagic hydrocephalus has been elusive because of the small size of the dog and the early onset of hydrocephalus, this study has demonstrated a relationship between the development of CSF pressure and blood flow velocity in the middle cerebral artery in dogs after blood depletion of the brain. The milder cerebral ischemia associated with the depletion of blood from the brainstem regions of the lateral and third ventricles resulted in the slower development of hydrocephalus. In addition to the basic similarities in the pathophysiology of human and canine hydrocephalus, the canine brain represents the best available model for studying the pathogenesis of pressure-induced gliopathy.
